

Possible answer:

I do not agree because there are examples such as 2.23×2 that gives an answer with only two decimal places.

$$\begin{array}{r} 3.45 \\ \times \quad 6 \\ \hline 20.70 \end{array}$$

£11.92

He should buy four packs of 6 plus an individual egg.

$$5 \times \pounds 2.95 = \pounds 14.75$$

$$7 \times \pounds 2.19 = \pounds 15.33$$

$$4 \times \pounds 2.95 = \pounds 11.80 + \pounds 2.19 = \pounds 13.99$$

Morgan is correct as four 6 packs will cost £11.80 ($4 \times \pounds 2.95$) and added to £2.19 for a 4 pack makes a total of £13.99.
